

THE CHALLENGE ORGANISATIONS FACE

harmonic

AI tools are being adopted rapidly across business teams, often outside of formal security or governance frameworks. In many organisations, employees are using public or embedded AI tools as part of everyday workflows, without clear visibility into what data is being shared or whether that usage aligns with regulatory and contractual obligations. As a result, leadership teams often lack a clear view of AI-driven data risk across the organisation.

THE EVOLVING AI RISK LANDSCAPE

AI-related risk is rarely driven by malicious intent. It more commonly arises from well-intentioned use of AI tools to improve efficiency and productivity. Without visibility and oversight, however, sensitive or regulated data can be unintentionally exposed, creating compliance, legal, and reputational risk. Traditional security controls are not designed to address this emerging category of data exposure.

WHAT HARMONIC SECURITY DELIVERS

Harmonic Security provides visibility into how AI tools are being used across the organisation and the types of data being shared with them. It enables organisations to identify high-risk or non-compliant data usage and apply proportionate controls that align with governance and regulatory requirements, without unnecessarily restricting legitimate business activity.

WHY PARTNER WITH CORE TO CLOUD FOR AI RISK PREVENTION

Core to Cloud acts as a trusted partner for organisations adopting Harmonic Security, providing clear guidance and commercial support throughout the process. We help assess suitability, align licensing to real-world requirements, and support a smooth progression from initial evaluation through to deployment.

Our role is to remove friction from adoption, ensuring Harmonic Security is implemented confidently, efficiently, and in a way that supports long-term security objectives rather than simply adding another tool.

THE OUTCOME

With improved visibility into AI usage and data flows, organisations are better positioned to govern AI responsibly, reduce the risk of unintentional data exposure, and demonstrate control to regulators, auditors, and customers, while continuing to benefit from AI-driven productivity.
